

JECO PLASTIC PRODUCTS For ASRS Systems

Jeco pallets are ideal for automated conveyor systems, robotic palletizers to racking storage systems. Jeco plastic pallets are the perfect complement to your ASRS maximizing operating speed and minimizing storage and handling problems. Unlike wooden pallets or other plastic options, Jeco Roto-molds our pallets which makes them virtually indestructible. Since they cannot absorb moisture, no dampness can migrate from Jeco pallets into signatures or bundles. Jeco plastic pallets do not splinter, fail under load, or cause load shifting due to sagging. No wood chips or broken pallet pieces mean less lost time due to machine stoppages. The smooth surface of Jeco plastic pallets reduces product damage. And because breakage and pallet repair are eliminated, fewer pallets are required to facilitate a plant and warehouse.

Jeco plastic pallets are manufactured to exacting tolerances and are dimensionally stable. They are also very rigid, eliminating the deflection and curvature which can cause problems for electronic positioning sensors. The consistent weight of Jeco plastic pallets means that they can be used with confidence in electronic weighing and counting systems. Systems with either roller or chain conveyors can use Jeco plastic pallets to great advantage, and models are available which can be accessed by forklift, floor jack from any side.

We have over 200 standard pallet variations and we can also create a cost effective custom version to support specific requirements.
